Dear Hiring Manager,

I'm a **Full Stack Developer** focused on building **production-grade web applications**, with a strong emphasis on **e-commerce systems**, automation pipelines, and internal admin tooling. I'm currently seeking a full stack / web application role where I can contribute immediately by shipping clean, reliable features and helping a team deliver results fast.

Most recently, I designed, built, and deployed **Legendary Collectibles**, a real e-commerce + collectibles platform built end-to-end using **Next.js, Node.js, PostgreSQL**, and modern deployment practices. The platform includes a database-driven catalog, admin workflows, automation scripts, and performance/SEO optimization—reflecting how I approach engineering: strong data modeling, clean UX, scalable backend architecture, and operational reliability.

Here are a few areas where I consistently deliver value:

- Full stack development with **Next.js (App Router), React, TypeScript/JavaScript**

- Backend + integrations including **REST APIs, authentication patterns, Stripe checkout/payment workflows**

- Data-first engineering using **PostgreSQL, SQL, schema design, and performance-minded queries**

- Automation pipelines and ETL-style jobs with logging, error handling, and restart-safe patterns

- Production operations with a reliability mindset: deployments, troubleshooting, and optimization

In addition to software development, I bring strong ownership and execution from over **10 years running a successful business**, which sharpened my ability to prioritize, communicate clearly, and deliver under real-world constraints. That experience translates directly into software: I'm comfortable taking responsibility, working independently, and driving projects to completion.

I would welcome the opportunity to contribute to your team and help ship high-quality software quickly and reliably. Thank you for your time and consideration—I'd love to connect and discuss how I can help your organization.

Sincerely,
 Troy Woldridge
